L9 ANSWER 12 OF 14 CAPLUS COPYRIGHT 2011 ACS on STN
 AB Hypertrophic scar was produced on the ears of 24 New Zealand white rabbits, which were employed as the model and were randomly and equally divided into control (CC) and matrine (M) groups (12 in each group). Matrine (50 g/L) was injected into the ear scar in M group and normal saline in C group once every four days. At 2, 4, 6, 8 and 12 wk after the injection, the apoptotic fibroblast count in the scar was determined by TUNEL method. The expressions of apoptosis related modulation proteins p53, Bcl-2 and Bax were detected by immunohistochem. method. The apoptotic fibroblast count was much larger in M group than that in C group at all test time points (P<0.05). Meanwhile, the Bax expression was increased and those of p53 and Bcl-2 were decreased significantly in M group. Furthermore, the scar became flat in M group. Thus, matrine may enhance the fibroblast apoptosis in rabbit ear hypertrophic scar, and up-regulate the expression of apoptosis modulation related protein Bax and down-regulate the expression of p53 and Bcl-2.

L9 ANSWER 13 OF 14 CAPLUS COPYRIGHT 2011 ACS on STN
 AB The present invention is based on the finding that sigma receptor ligands can modulate endothelial cell proliferation and/or survival, and hence control angiogenesis, and in particular that sigma receptor ligand antagonists can be used to inhibit angiogenesis and so treat conditions such as psoriasis, diabetic retinopathy and cancer. Exemplary compds. include IPAG and rimcazole.

L9 ANSWER 14 OF 14 MEDLINE on STN
 AB OBJECTIVE: To investigate the mechanism of steroid in treatment of abnormal scars.

METHODS: Apoptosis of different fibroblasts from 6 samples with keloid, 6 samples with hypertrophic scar, and 6 samples of normal skin was observed under the condition of the media containing steroid in vitro. Proliferation, biosynthesis and apoptosis of fibroblasts of 6 samples of hypertrophic scars treated with intralesional injection of steroid were studied in vivo.

RESULTS: Steroid could induce apoptosis of different fibroblasts in vitro

in correspondence with increasing ratio of Bax/Bcl-2 proteins. Intralesional injection of steroid could inhibit proliferation of fibroblasts from hypertrophic scars by inhibiting PDGF-BB gene expression in vivo. Intralesional injection of steroid could inhibit procollagen gene expression to prohibit type I and III protein syntheses of fibroblasts from hypertrophic scars in vivo by inhibiting gene transcription. Intralesional injection of steroid could increase c-myc and p53 gene expression of hypertrophic scars in vivo, which induced apoptosis of cells.

CONCLUSION: The effects of steroid on abnormal scars were achieved by inhibiting proliferation and biosyntheses of fibroblasts and promoting apoptosis of fibroblasts.
